

ABSTRACT OF THE DISCLOSURE

A system and method for monitoring multiple online resources in different formats includes a format transformer, an analytic parser, and a file comparator. The format transformer converts each monitored online resources to a strict formatted file. An analytic parser identifies relevant data within each of the strict formatted files. A comparator determines whether the relevant data has been changed by comparing it to an archived copy of the relevant data. If a change occurred, an individual is automatically notified and a database updated.
